4. ARAMBH

"It is a web-based application built using MERN technology that helps Indian customers in all the different categories of loans. This application is made to make the easy of customers who are looking for a loan with least interest rates, we have also enabled consulting facilities for these users."

- Created Functional Requirement Specification document.
- Developed workflow for team members to function.

- Led cross-functional teams to deliver platform capabilities predictably, resolving blockers and coordinating decisions across teams and external partners.
- Drove strategic technology initiatives to strengthen platform security, scalability, reliability, and customer experience across the group's products.
- Established risk and resilience plans for service disruptions, cyber incidents, and other operational emergencies, coordinating preparedness and response with relevant teams.
- Applied iterative delivery practices to improve planning, execution, feedback cycles, and release quality while adapting priorities to changing business needs.
- Monitored delivery health and outcomes, identifying schedule, scope, budget, and dependency risks early and leading corrective actions to keep initiatives on track.
- Maintained clear stakeholder communication through regular leadership updates on progress, milestones, risks, decisions, and key performance indicators.

2. VARA Regulated Dubai based exchange

"This MERN based VARA regulated web application where the future of finance meets the power of blockchain technology. This application evolutionize traditional banking, investing, and transactions, putting control back into the hands of the people."

- Managed end-to-end development and deployment of the crypto exchange platform, ensuring timely delivery of features and functionalities.
- Coordinated with development teams, architects, and stakeholders to define project scope, requirements, and timelines.
- Lead initiatives to integrate new technologies and features into the exchange platform, enhancing security, scalability, and user experience.
- Developed contingency plans to address system failures, cyberattacks, or other emergencies affecting platform operations.
- Implemented iterative development processes, such as Agile methodologies, to continuously enhance platform features and functionalities.

3. CHASMLABS

"This PHP based web application has been built with a responsive design that opens a trading platform of Crypto Currencies for users. This website enables functionalities such as buying, selling, and transferring digital assets known as cryptocurrencies for US-based blockchain enthusiasts."

- Responsible for day-to-day management within the platform.
- Change Management, Incident Management, Problem Management, Service Catalog, Configuration Management, Reporting, Discovery, and Integrations.
- Managed intake and requirements gathering for corporate-wide instances.
- Maintain Service level agreement (SLA) and monitor KPI Workflow.
- Managed status reporting, project scrum meetings, and demos.
- Implemented best practices at every step of the development & testing phases.

5. PG INTEGRATION

"It is an integration-based service platform that helped other web/mobile applications accept digital payments. It helps business giants implement the service of online payments adhering to all government regulations."

- Worked on analyzing the project details and based on that created documentation.
- Set up development, testing, infrastructure, & DevOps team to create the platform from scratch.
- Managed a team of 12 having different domains.
- Involved in setting up development & testing processes following the best practices.
- Set up a knowledge base for the client's internal team.
- Worked on creating an internal incident manager which streamlined the process of raising and solving incidents.
- Consulted the client on each and every step for a better vision expansion of the product.
- Applied all PCI-DSS norms which helps in sustaining the services for all end-customers.

6. ONLINE WALLET

"Wallet services are built for the customer to do online transactions using a digital wallet. Users can add, withdraw, and transfer money from that wallet & also perform transactions from that."

- Created Business requirement documents with clients and built modules based on them.
- Worked closely with Development and QA team to create the flow of services.
- Set up a TechOps and Support team for handling daily BAU activities smoothly.
- Enhanced and improved tech infrastructure for better operability of service experience.
- Implemented scrum calls with sprint demos to work in the best ways possible.
- Handled post live operational, transactions, and technical activities with the team.
